In this lesson, you will learn different styles of trading that is closely related to the holding time of the asset. Nevertheless, the ultimate goal remains the same: to make profit.

Trading Time Frame				
	Scalping	Intraday Trading	Swing Trading	Buy & Hold
Chart Time Frame	M1 to M15	M15 to 1HR	1HR to D1	D1 to W1
Holding Period	Seconds to minutes	Less than a day	Days to weeks	Weeks to months

Buy & Hold

These traders take a longer-term view of the market and are willing to hold positions for weeks, months, or even years. They often use fundamental analysis to identify macroeconomic trends and long-term economic factors that may affect the markets, such as GDP, inflation, interest rates, and geopolitical events.

Position traders tend to focus on higher timeframes, such as the monthly and weekly charts, to identify major trends and price levels. They may use technical analysis to time their entries and exits on the daily timeframe, but their decision-making process is primarily driven by fundamental analysis.

Position traders typically have a lower tolerance for volatility and may use stop-loss orders or other risk management techniques to protect their positions. They are also more patient than other traders, as they are willing to hold their positions for longer periods of time to capture larger market moves.

Swing Trading

Swing traders hold positions for a few hours to a week, typically using the 4-hour timeframe to analyze the markets. They combine economic reports, such as CPI, PPI, and NFP, with technical indicators to identify potential trading opportunities that offer the best risk-to-reward ratios.

Swing traders are very disciplined and patient. They closely monitor their positions throughout the day, checking in on the market at specific times when new candles print, usually at 9 am EST, 1 pm EST, and 5 pm EST. This allows them to make informed decisions based on the most recent market information.

Swing traders require a lot of patience and discipline to let the market run its course and only step

in to adjust their trailing stops to secure profits. They are willing to give their positions some room to move, but also know when to cut their losses and move on to the next trade. This requires a lot of discipline and emotional control, as it can be tempting to exit a position too early or hold on to a losing trade for too long.

Intraday Trading

Intraday traders may have the opportunity to trade in multiple sessions throughout the day, it is true that the London session tends to be the most active and offers the greatest trading opportunities. In particular, the pre-London session, which starts at 2:30 am EST, can provide a high hit rate for intraday traders.

Intraday traders typically use 1-hour candle charts to view their trades and may look for setups that last for 2 to 3 hours. They need to constantly monitor the markets for trending conditions and range-bound markets, looking for potential breakouts and pullbacks.

Successful intraday trading requires a great deal of discipline and focus, as traders need to make quick decisions and manage risk carefully to avoid large losses. Intraday traders may use technical analysis, such as support and resistance levels, trendlines, and moving averages, to identify potential trading opportunities and set their entry and exit points. They may also use stop-loss orders and other risk management techniques to protect their positions.

Scalping

Scalping is a very short-term trading style where traders aim to make small profits from small price movements. Scalp traders often look for setups with a risk-to-reward ratio of 1:1, where they risk a certain number of pips to gain an equal number of pips.

The best setups for scalping are often similar to those preferred by intraday traders, with the pre-London session at 2:30 am EST being a popular time to trade the EUR/USD and GBP/USD pairs.

Scalp traders typically only hold a position for a few minutes to an hour at most, and they may take many trades throughout the day. This requires quick decision-making skills and the ability to manage risk effectively. Scalp traders may use technical analysis, such as price action, support and resistance levels, and moving averages, to identify potential trading opportunities and set their entry and exit points.

Overall, scalping is a very high-energy and fast-paced trading style that requires discipline, focus, and the ability to make quick decisions in a rapidly changing market environment.
